

From manual workflow to AI-native organization

From fragmented tools to an autonomous, high-performance organization

People × Process × AI = **compounding impact**

Start where the workflow breaks.

Connect knowledge and assign ownership before increasing autonomy.

Fragmented tools

People rebuild context at every handoff.

➤ **Connect knowledge**

Repetitive work

Teams spend capacity copying and routing.

➤ **Automate handoffs**

Slow decisions

Evidence arrives after the decision window.

➤ **Surface insights**

Choose a high-volume workflow with a measurable outcome and an accountable owner.

Autonomy grows inside a clear operating model.

People own outcomes; agents execute within policy; the platform supplies context and control.

People

Outcome ownership
Exception review
Workflow design

Agents

Bounded execution
Context-aware actions
Traceable handoffs

Platform

Connected knowledge
Identity and policy
Evaluation and telemetry

Expand permissions only when evaluations and operational evidence justify the next level.

Three years. Three gates. Evidence at every step.

Foundation in 2026, scale in 2027, autonomy in 2028.

2026

Foundation

- Connect knowledge
- Set identity and policy
- Pilot two workflows

Gate: reliable first value

2027

Scale

- Roll out team copilots
- Automate cross-team flows
- Measure adoption and ROI

Gate: repeatable outcomes

2028

Autonomy

- Deploy bounded agents
- Orchestrate end-to-end flows
- Optimize continuously

Gate: controlled autonomy

Fund the foundation. Measure the transformation.

Release investment in stages, with explicit evidence for each expansion.

2

Pilot workflows

Named owners and documented baselines

90 days

First evidence gate

Value, adoption and quality measured

3

Success measures

Time saved, cycle time and error rate

Approve the foundation phase: knowledge, governance and two measurable workflow pilots.
